

Social Behavior of Nonhuman Primates: Effects on Brain Dopamine Systems and on Cocaine Reinforcement

Michael A. Nader, Paul W. Czoty,
Susan H. Nader, Robert Gould,
Michelle Icenhower, Natallia
Riddick and Jay R. Kaplan

OUTLINE

1. Factors that predict social rank in male and female cynomolgus monkeys

Body weight, locomotor activity, hormone levels, receptor availability

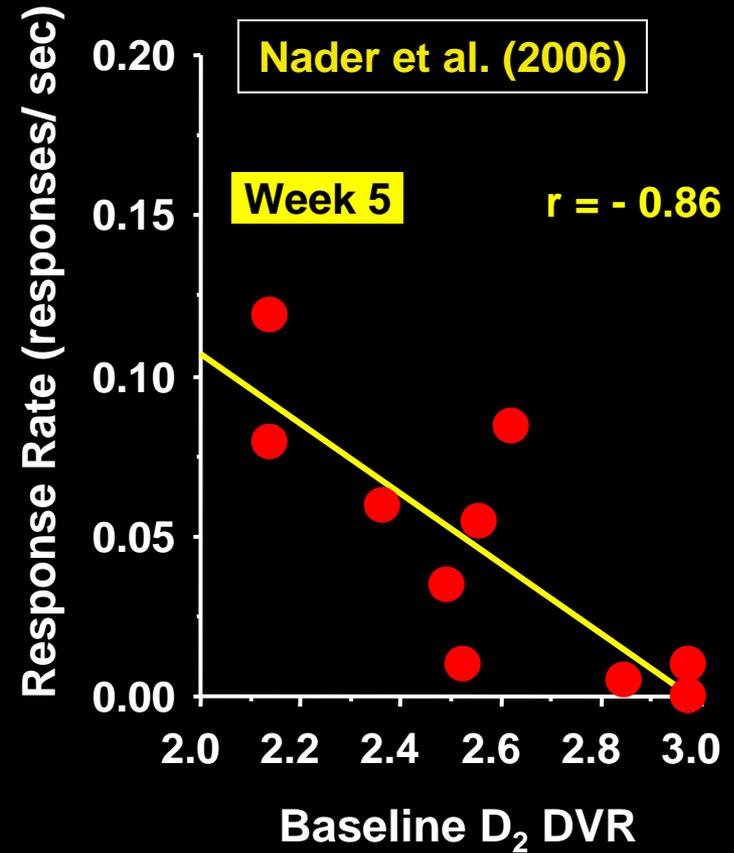

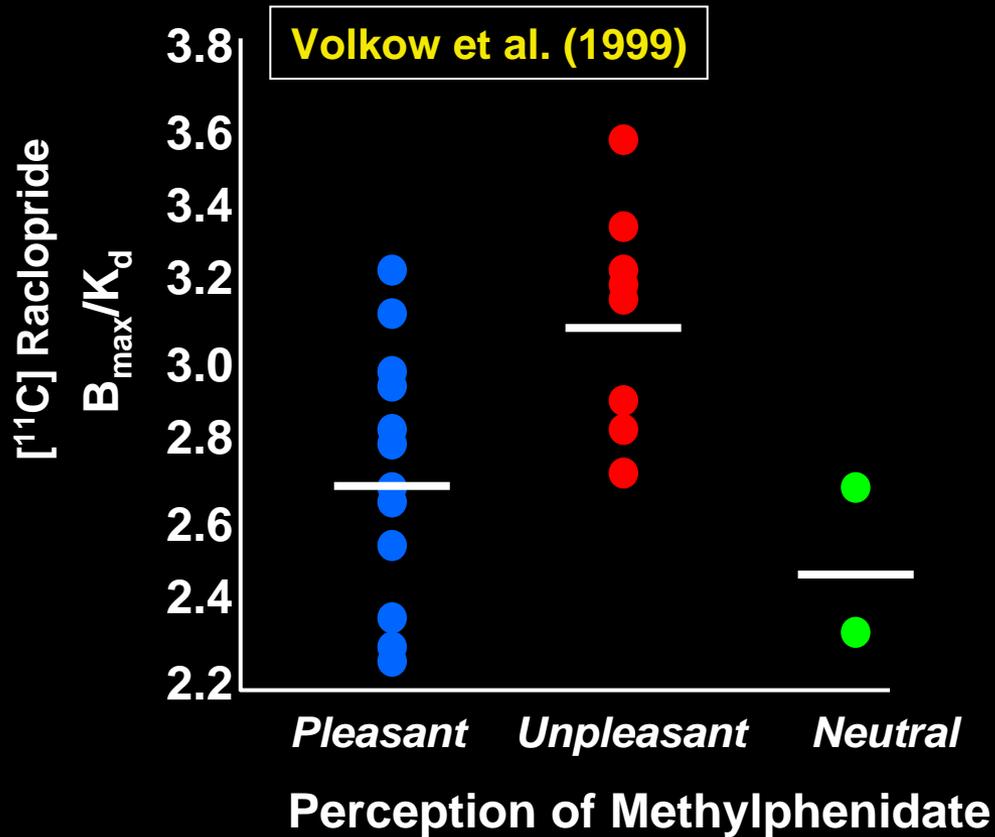

2. Variables that change as a consequence of social group formation

Dopamine D2 receptor availability, cocaine self-administration

3. Variables that are affected by abstinence and social re-organization

Dopamine D2 receptor availability, cocaine self-administration

Inverse Relationship between D2 Availability and Reinforcement

Types of Animal Models

I. Predictive

- Does not resemble the disease in terms of etiology or symptomatology, but is predictive of clinical outcome.

II. Isomorphic

- Resembles the disease in terms of symptoms and predictive outcome, but is artificially produced in the lab.

III. Homologous

- Resembles the disease in terms of etiology, symptomatology, and predictive outcome.

Genetic vs. Environmental Modulation

Trait Variable - a distinguishable characteristic of one's personal nature.

State Variable - a distinguishable characteristic attributable to environmental circumstances.

Modeling Addiction: Trait vs. State Variables

Vulnerability

- genetic or environmental factors mediating predisposition during early exposure

Maintenance

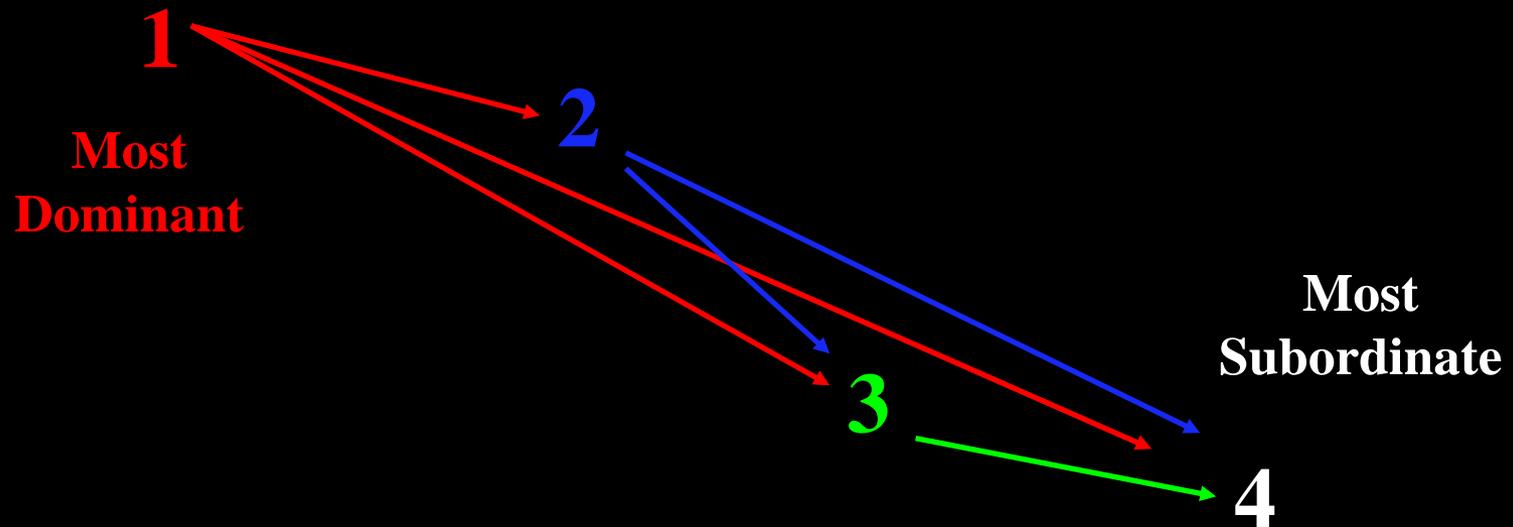

- behavioral & neurobiological consequences of repeated use

Abstinence

- recovery of cocaine-induced changes
- long-term changes that influence relapse

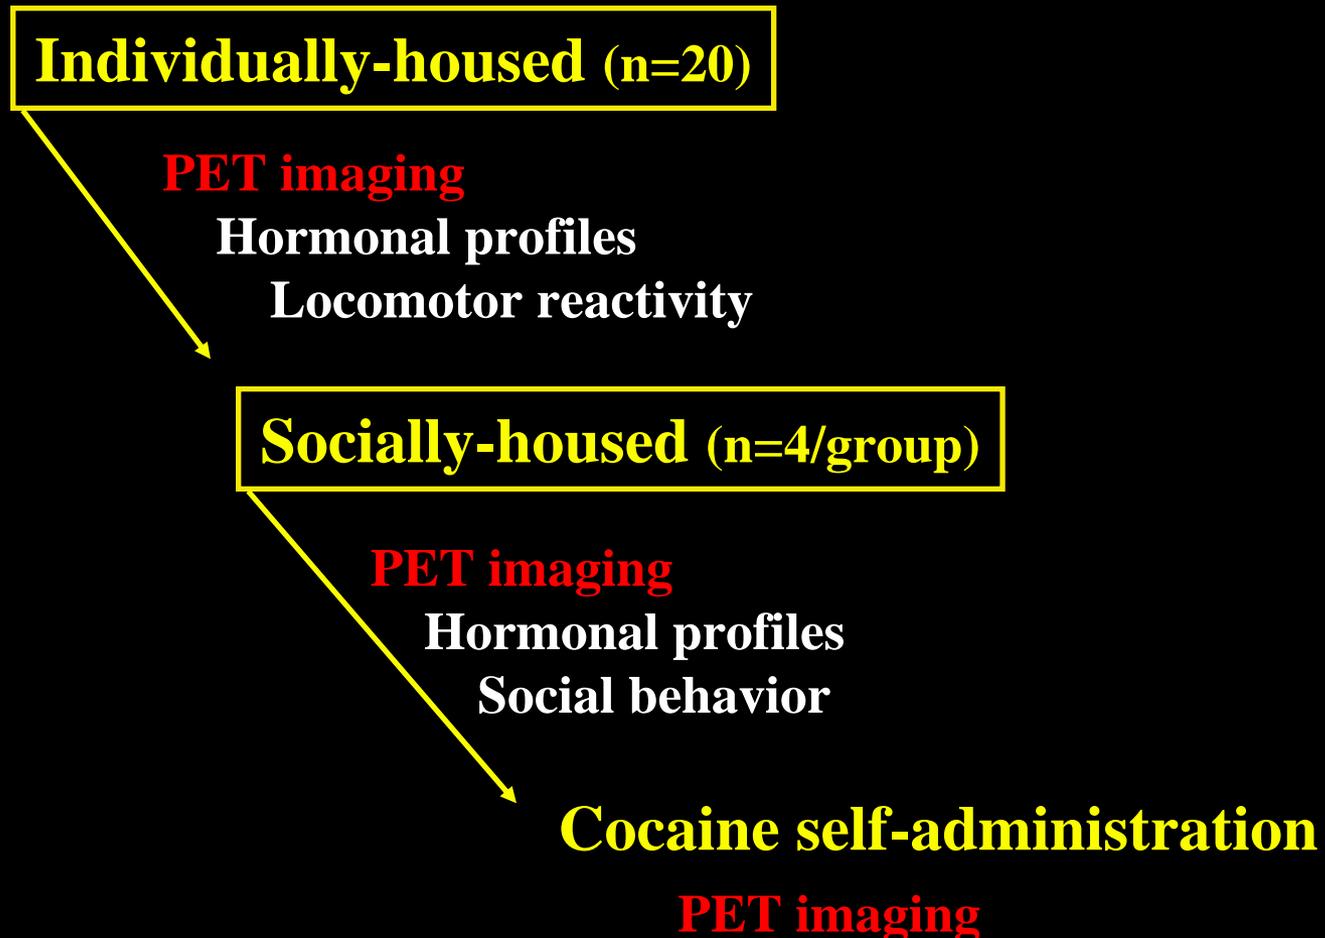

Social Rank

Based on the outcomes of agonistic encounters (i.e. fights)

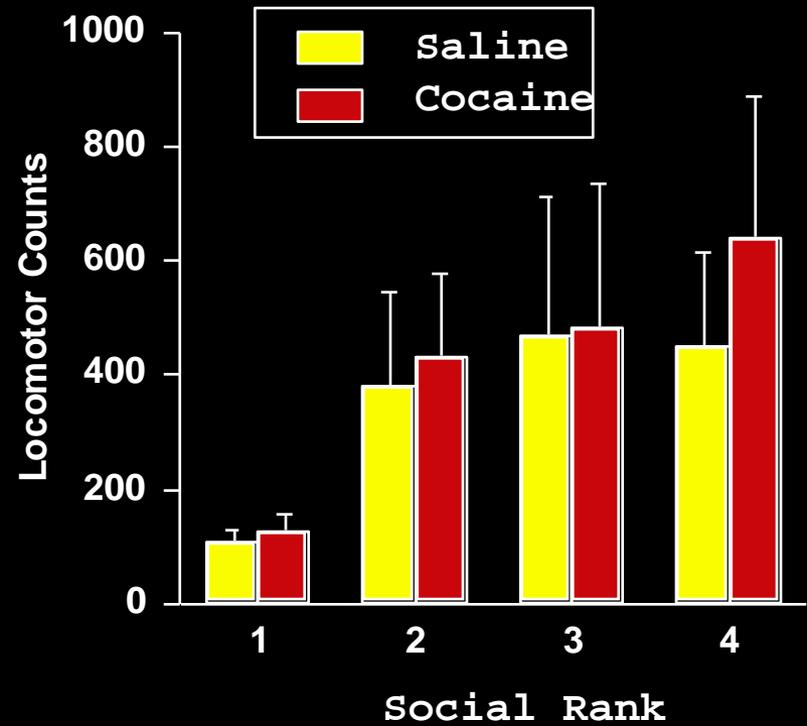

Vulnerability to Cocaine Use

What are some of the **neurobiological**, **neuroendocrine** and **behavioral** predictors and consequences of cocaine use?

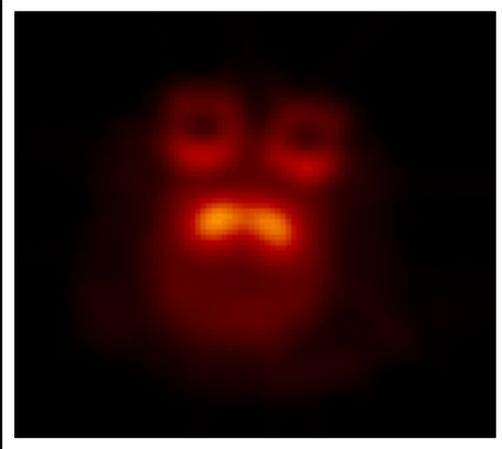

Locomotor Reactivity

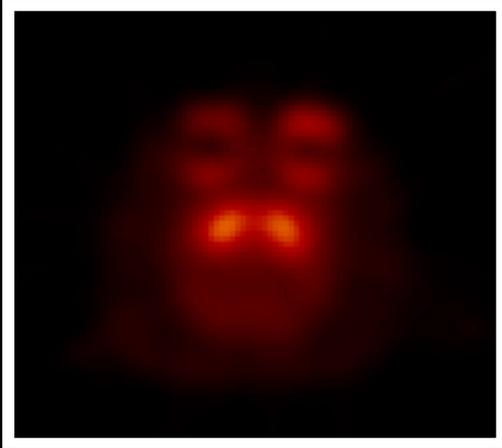

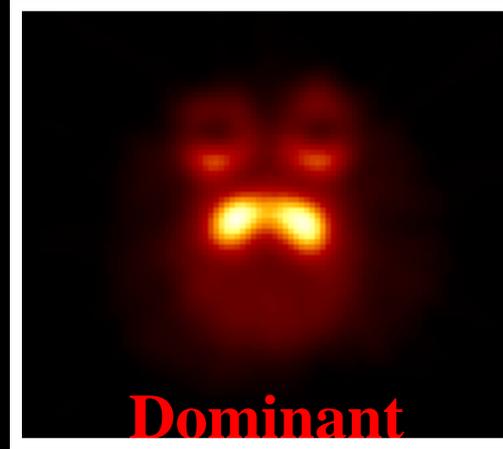

Morgan et al. (2000) *Am J Primatol* 52: 115-131

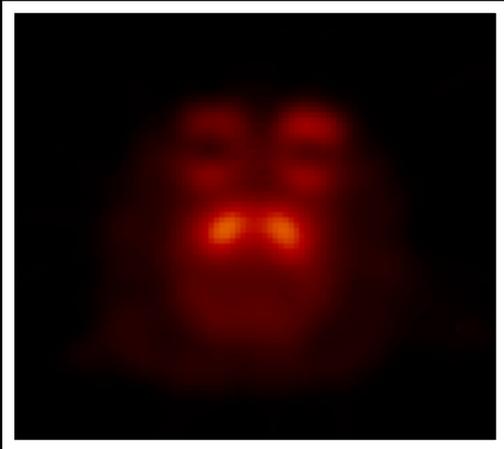

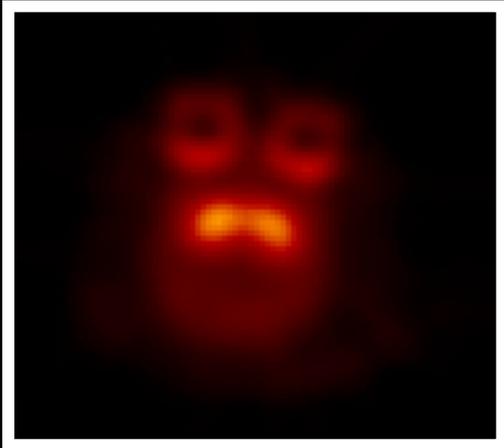

**Individually
Housed**

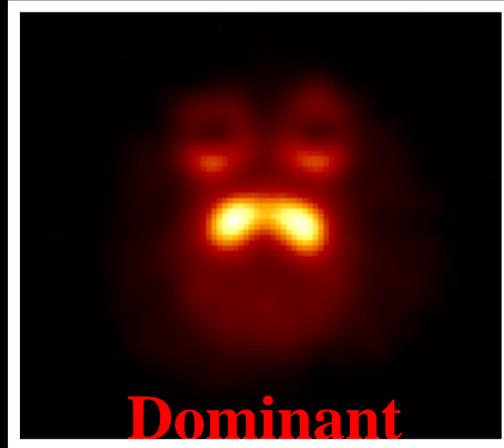

**Socially
Housed**

Housed**

**REINFORCERS
(per session)**

Environmental Variables, Brain Function and Cocaine Abuse

Female Cynomolgus Monkeys

Individually housed
n=16

Socially housed
n=4/pen

Behavioral measures

- Locomotor activity
- Impulsivity, novel object

PET

- [^{18}F]FCP
- [^{18}F]FCT
- [^{11}C]DASB

CSF

- 5-HIAA, HVA, 5-HT

Behavioral measures

- Social behavior
- 5-HT drugs

PET

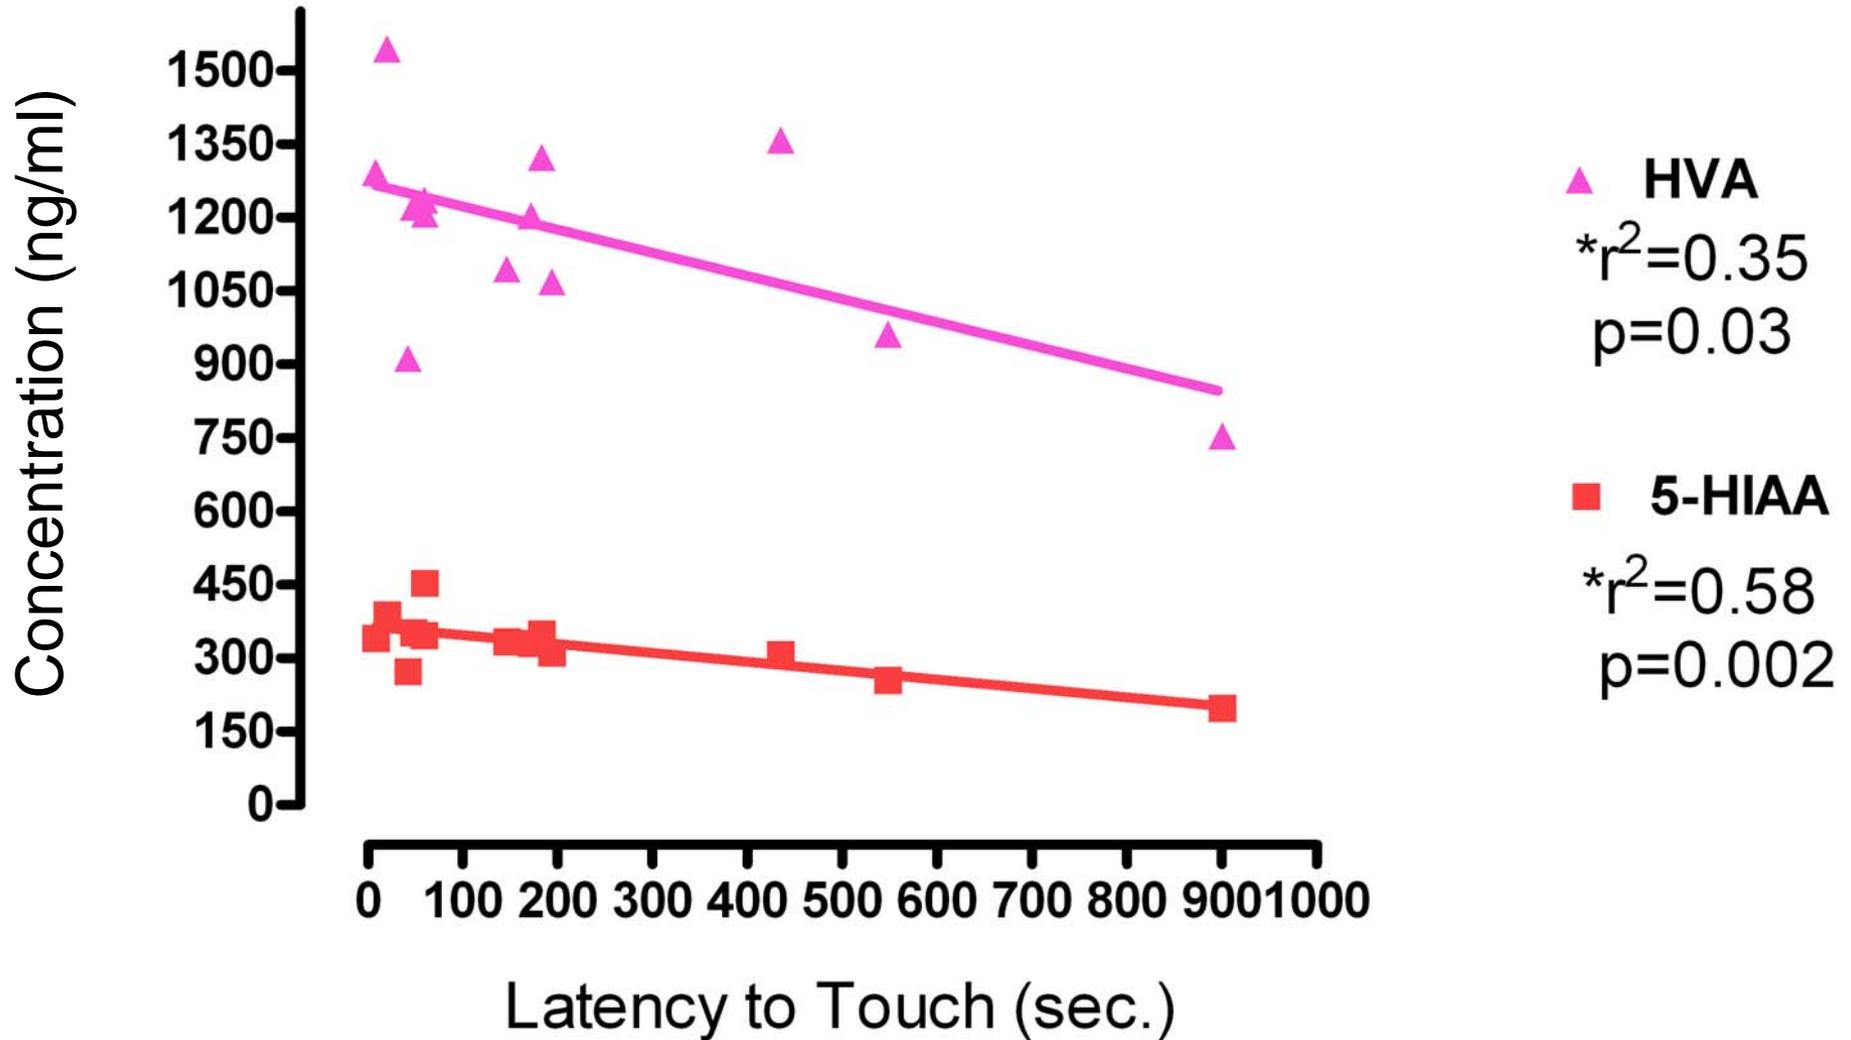

- [^{18}F]FCP
- [^{18}F]FCT
- [^{11}C]DASB

CSF

- 5-HIAA, HVA, 5-HT

Cocaine self-administration

Impulsivity and CSF Metabolite Levels

Modeling Addiction: Trait vs. State Variables

Vulnerability

- genetic or environmental factors mediating predisposition during early exposure

Maintenance

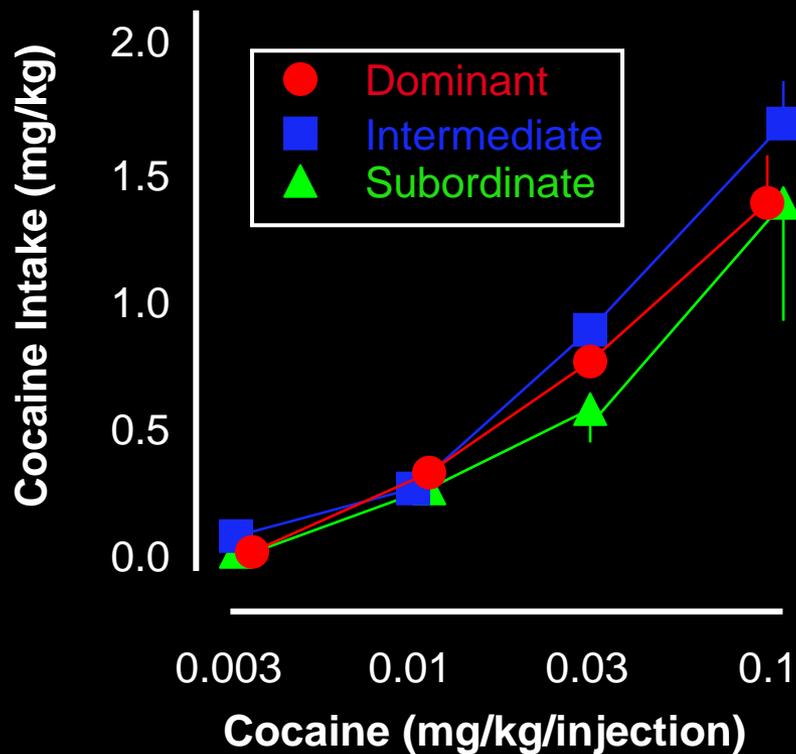

- behavioral & neurobiological consequences of repeated use

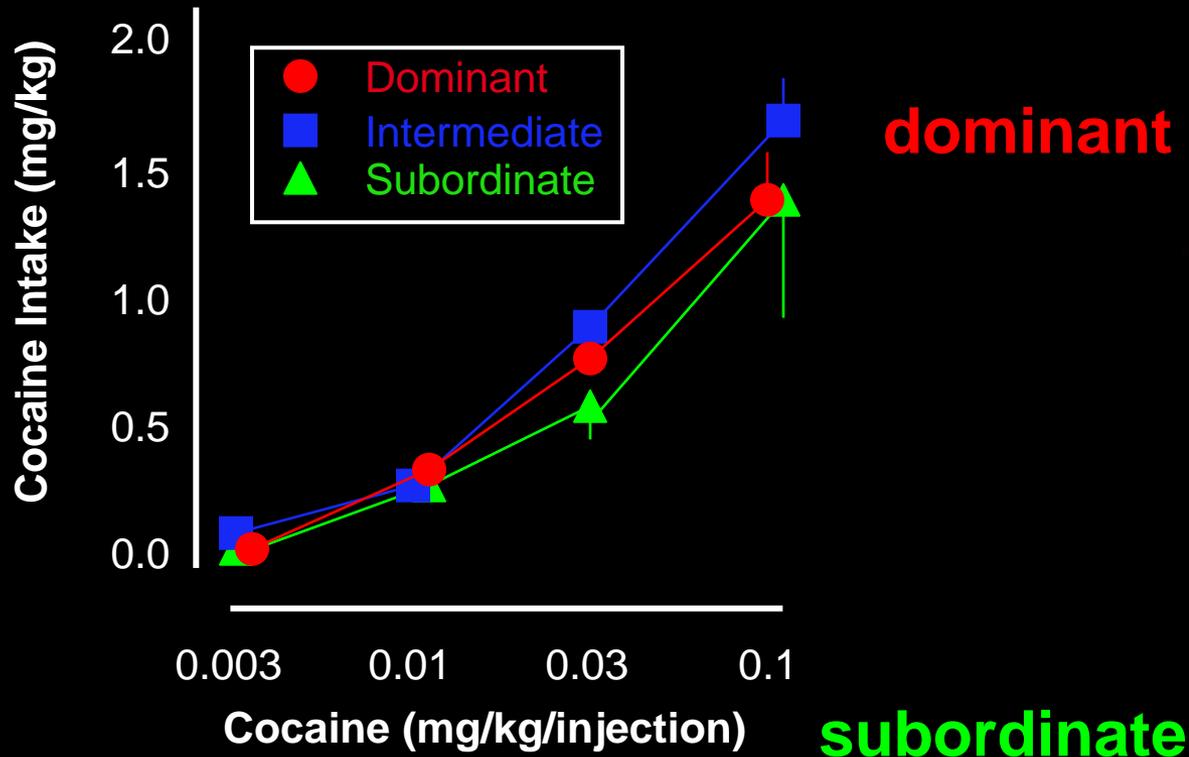

Abstinence

- recovery of cocaine-induced changes
- long-term changes that influence relapse

After 2-5 years of cocaine self-administration ...

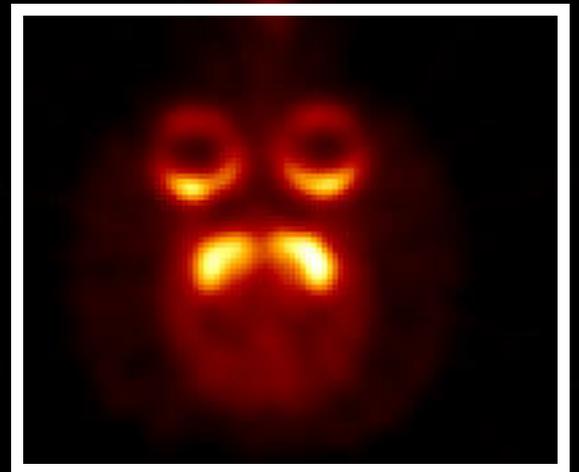

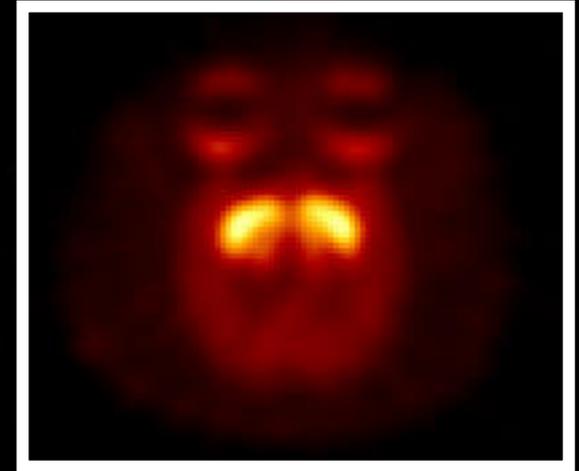

After 2-5 years of cocaine self-administration ...

dominant

subordinate

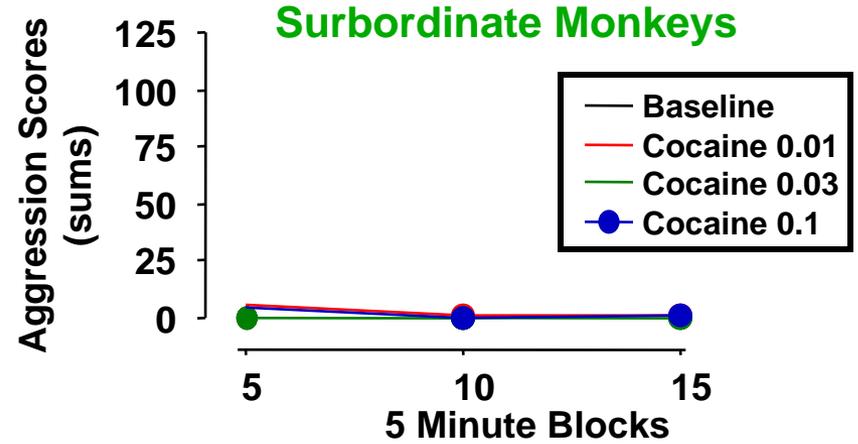

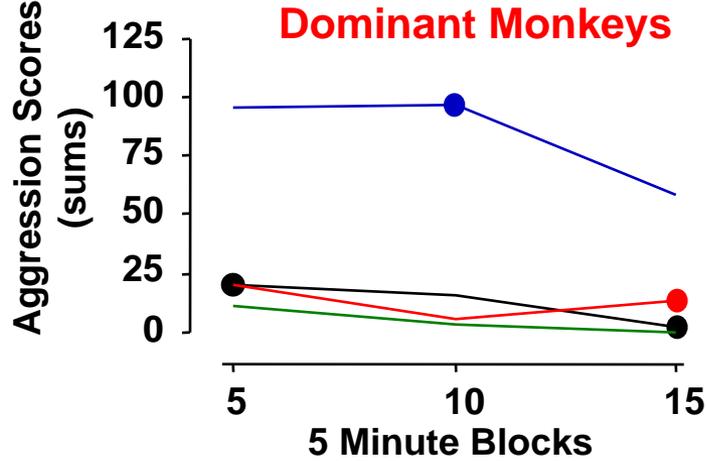

Interactions of cocaine reinforcement with social behavior

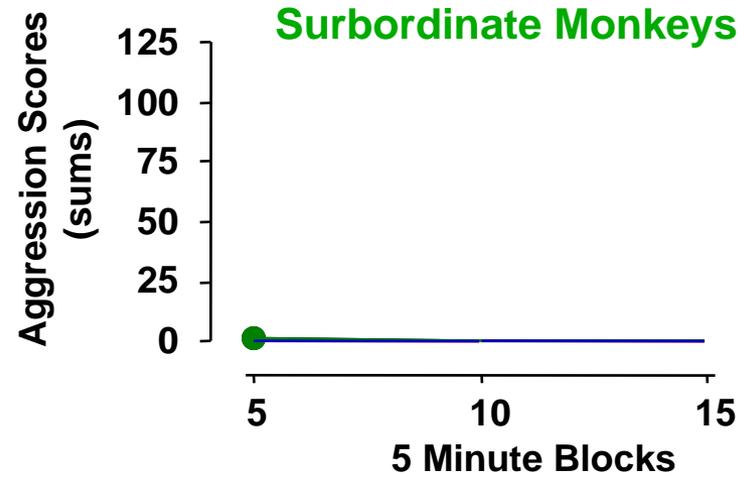

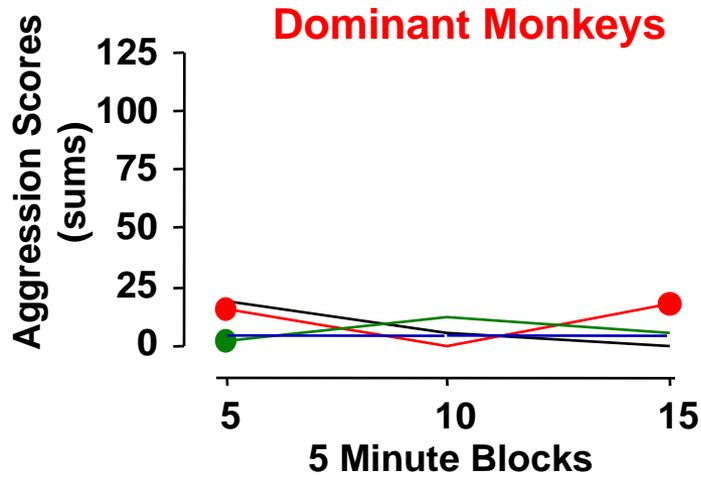

Methods

- Cocaine (saline, 0.03-0.3 mg/kg/inj) dose-response curve determined. *Only one monkey per social group self-administered cocaine (Mon-Fri).*
- **Dependent variables:**
 - (a) response rates as a function of dose
 - (b) social behavior (aggression, affiliation)

Dominant Monkeys Self-Administering

Surbordinate Monkeys Self-Administering

Issues Related to Decision Making in Cocaine Abusers

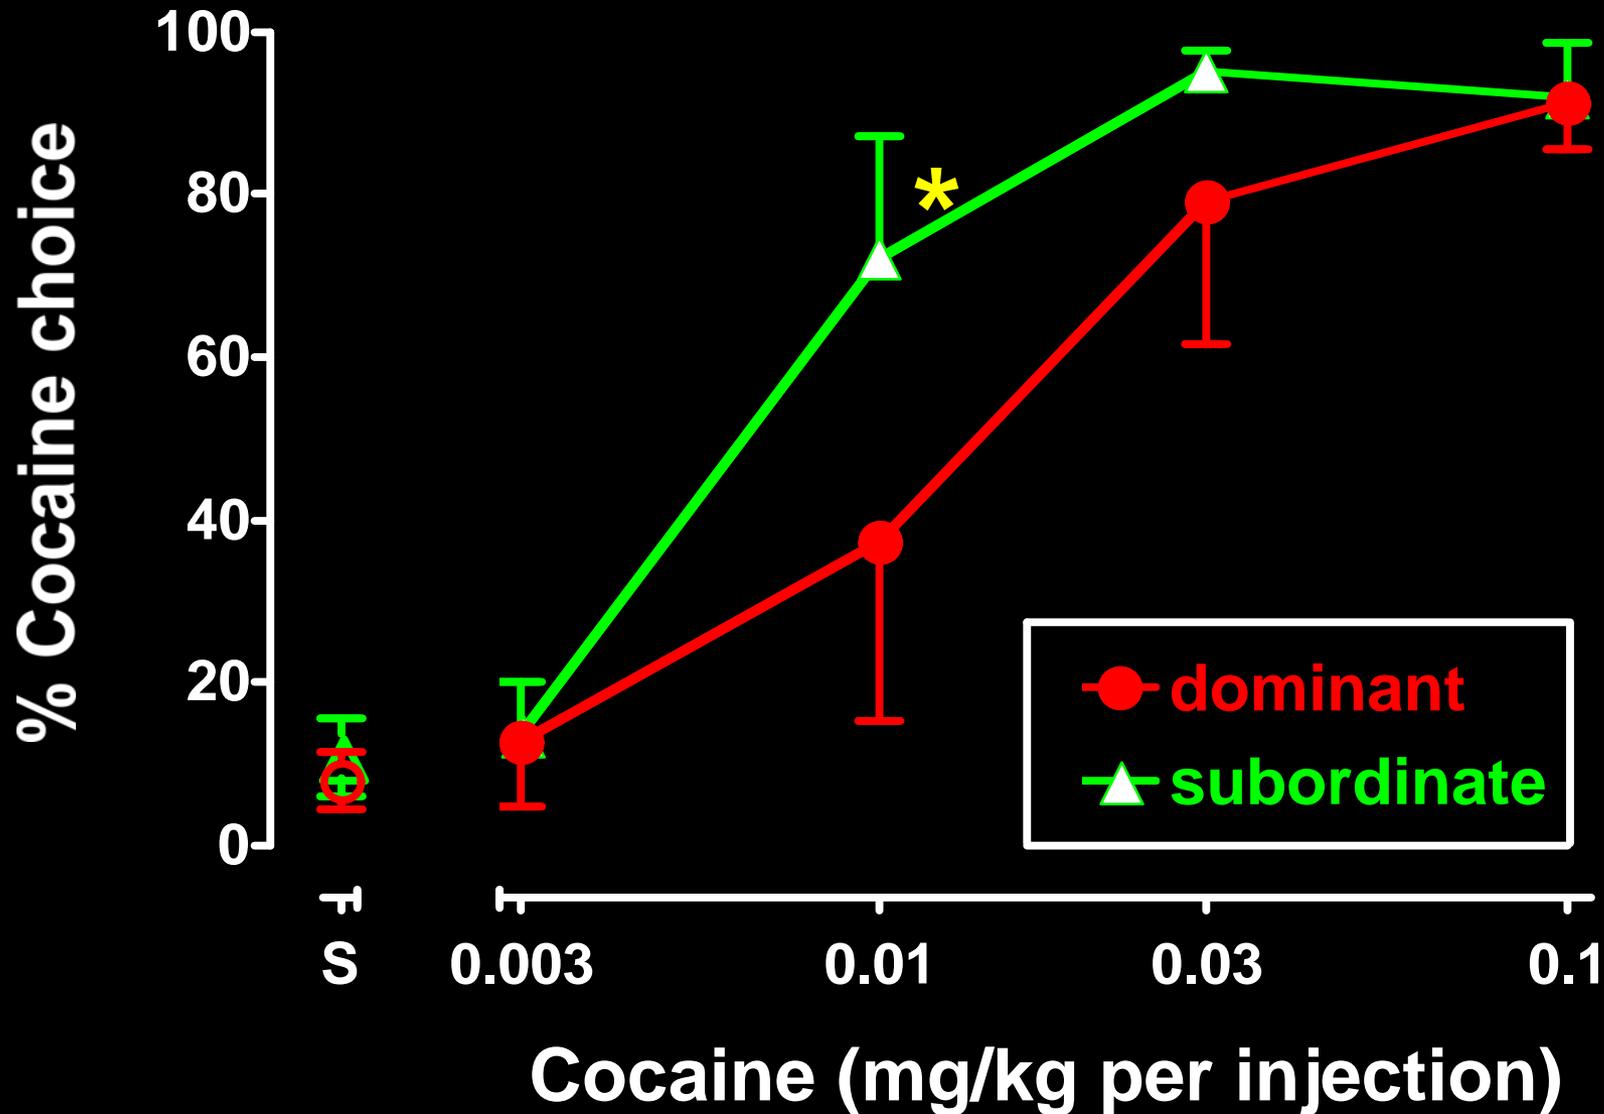

Cocaine abusers:

- make poor decisions
- are highly impulsive
- over-value cocaine relative to other reinforcing activities

Single-lever self-administration procedures do not take into account the aspect of *choice*

Solution: *concurrent (simultaneous) availability of cocaine and another reinforcer*

Cocaine choice in socially housed monkeys

Modeling Addiction: Trait vs. State Variables

Vulnerability

- genetic or environmental factors mediating predisposition during early exposure

Maintenance

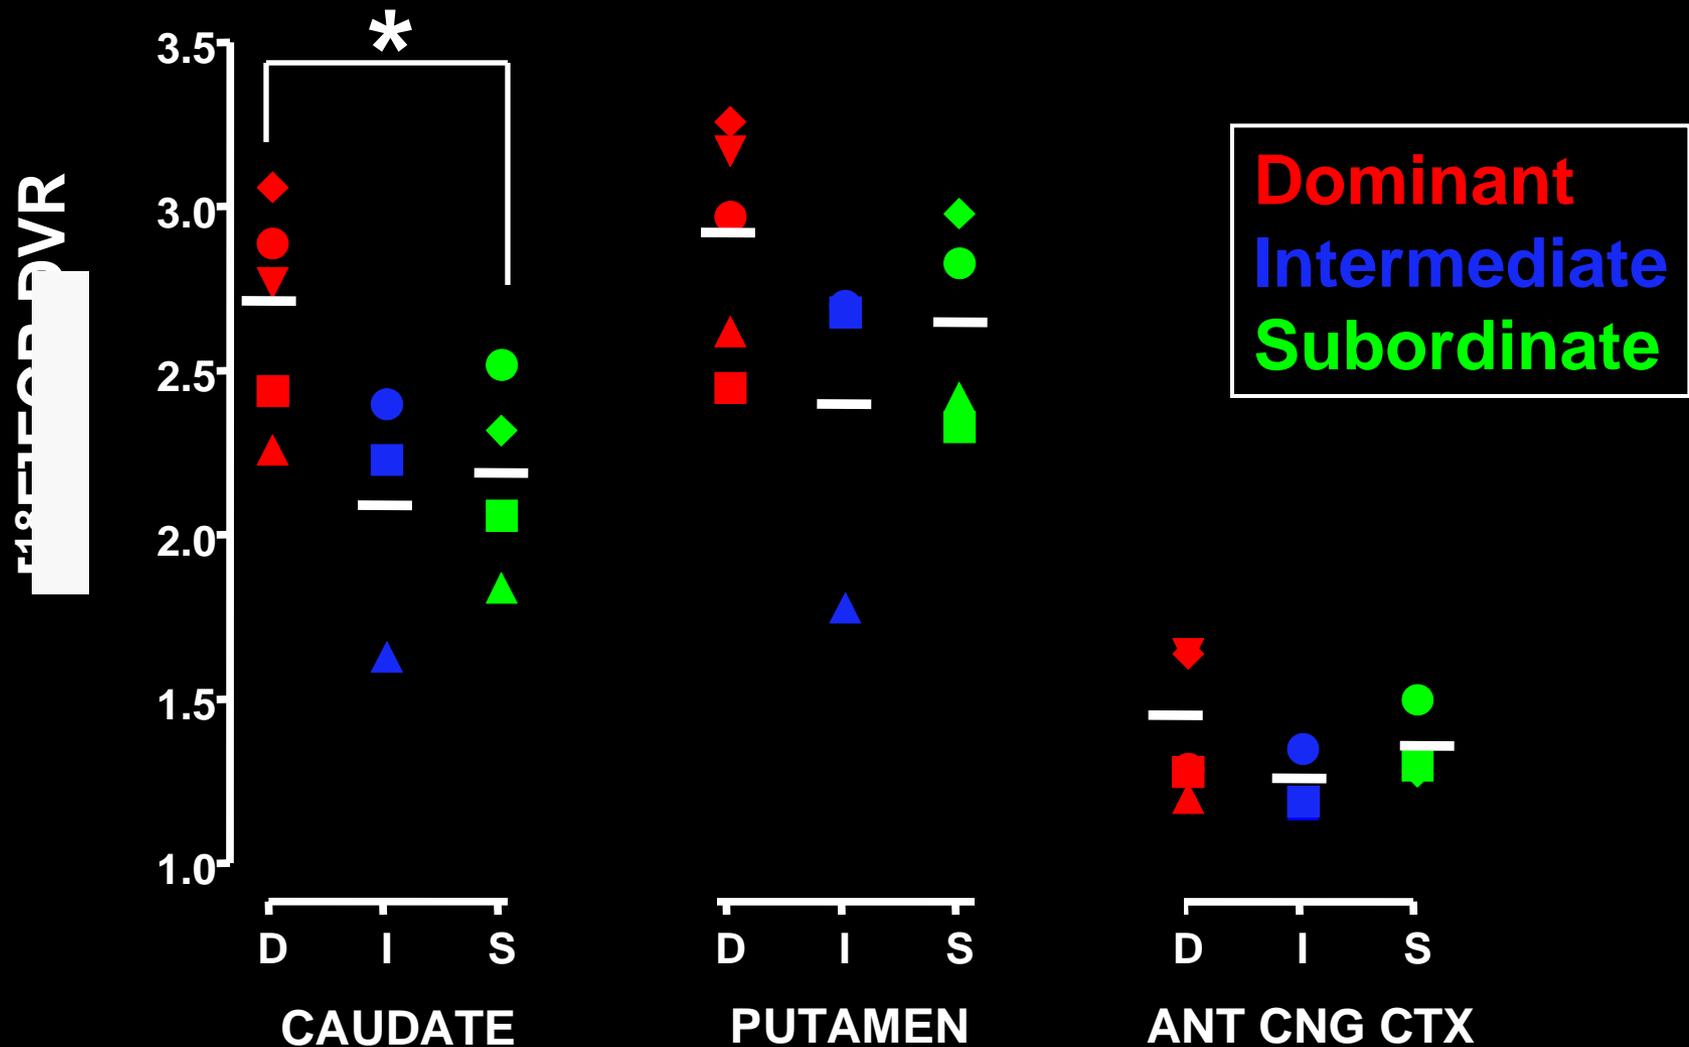

- behavioral & neurobiological consequences of repeated use

Abstinence

- recovery of cocaine-induced changes
- long-term changes that influence relapse

Recovery of rank-related differences during abstinence from cocaine

What's next? Social reorganization:

Can changes in the environment produce changes in D2 receptors and cocaine reinforcement?

4 Dominant

4 Subordinate

4 Intermediate

4 Intermediate

**2 Intermediate
2 Naïve**

4 Naïve

Social Reorganization

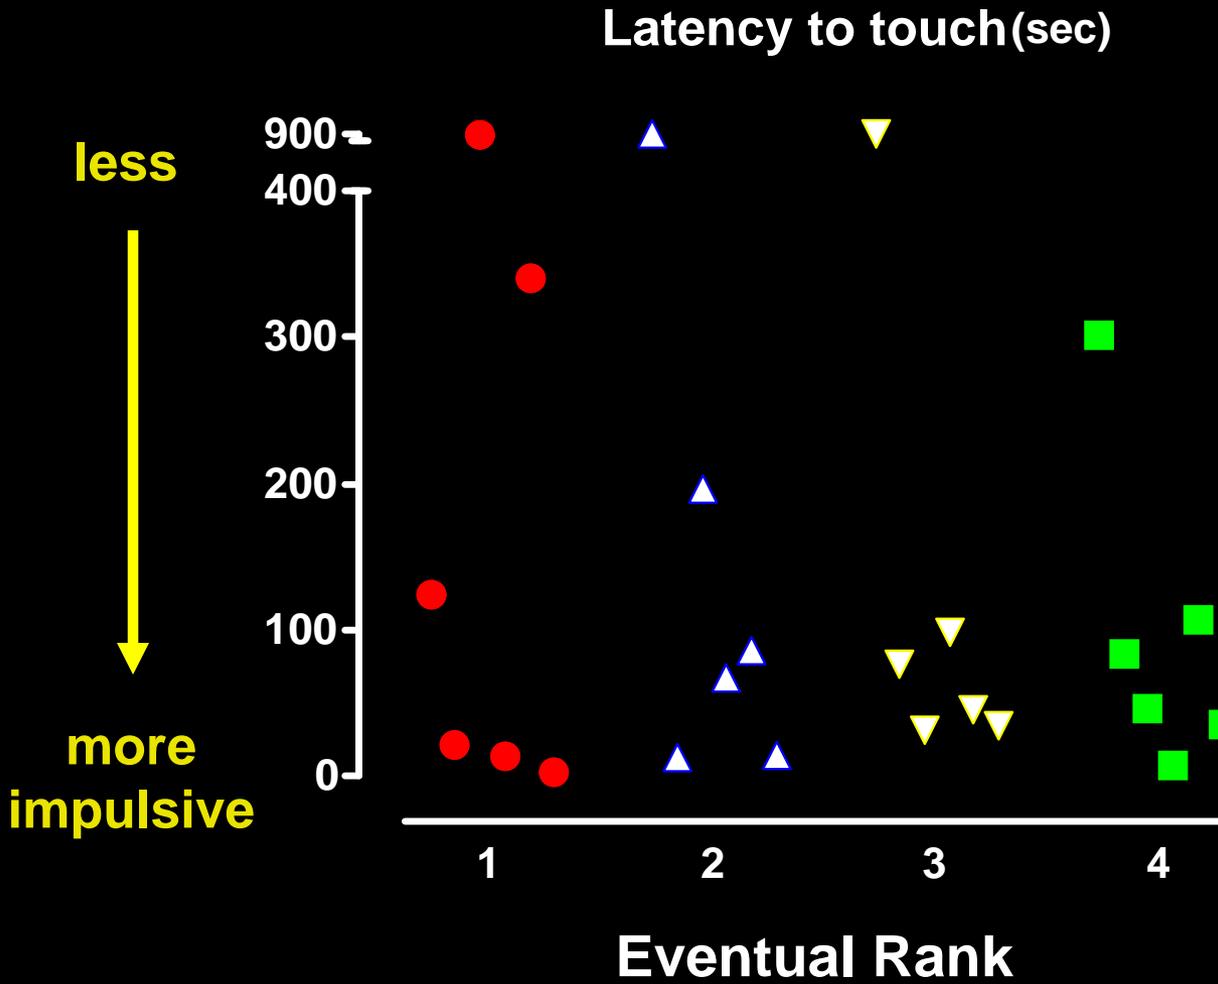

What are some of the predictors of social rank?

Measures of “impulsivity”
Cortisol levels

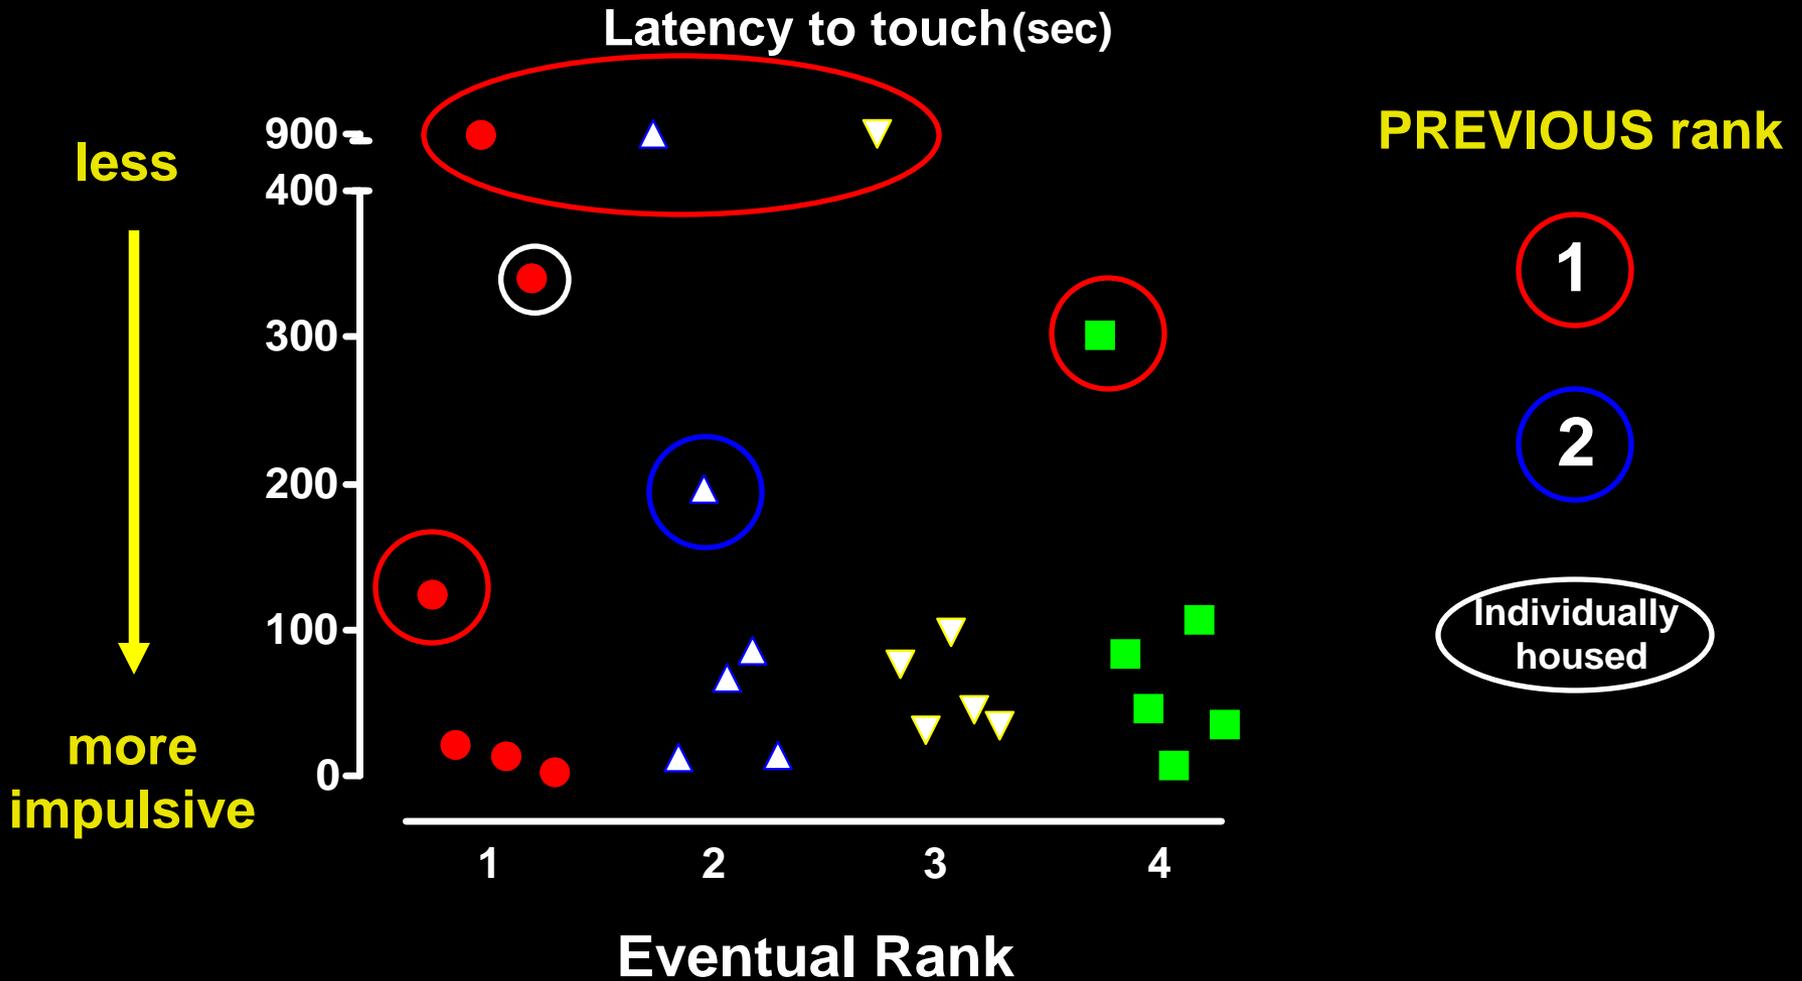

What are some of the consequences of the new social rank?

Cortisol levels
Social behavior
PET imaging
Cocaine self-administration

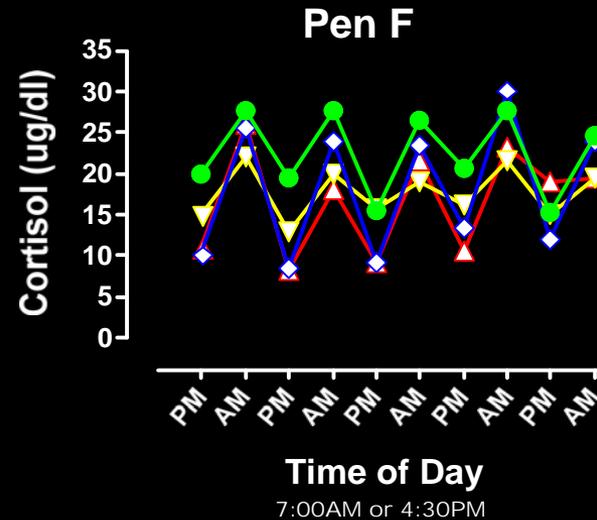

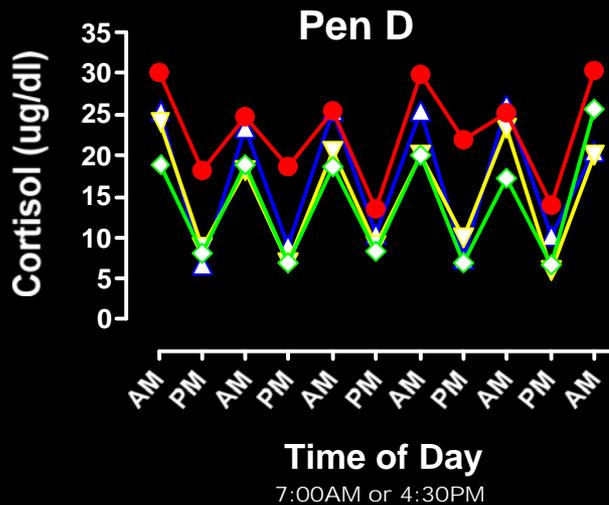

“Impulsivity” did not predict eventual social rank

“Impulsivity” did not predict eventual social rank, but was related to previous social rank.

Diurnal cortisol fluctuations prior to social housing

Group data:

Eventual rank

a.m.

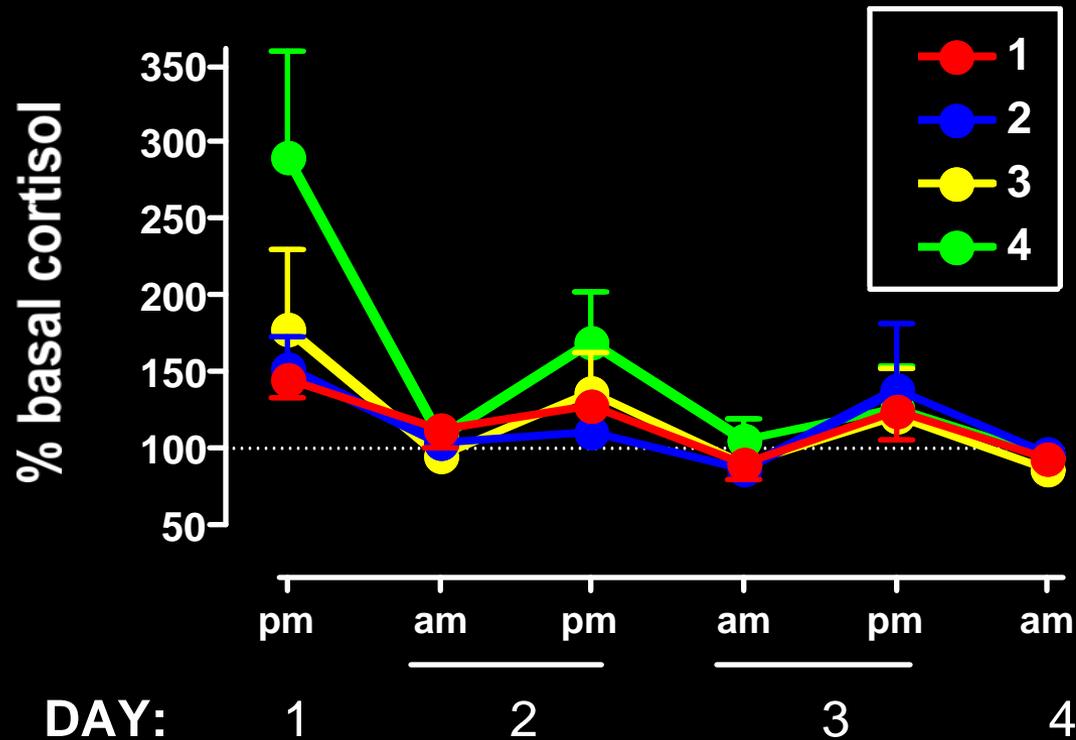

p.m.

1	23.8 ± 2.2	14.8 ± 2.4
2	20.0 ± 1.2	11.7 ± 1.9
3	22.2 ± 2.7	11.7 ± 3.0
4	20.4 ± 2.2	10.6 ± 2.4

Basal cortisol levels do not predict eventual rank

Cortisol levels during initial social housing

Monkeys were individually housed overnight, group housed during the day.

n = 6 @ each rank

Social reorganization- determining hierarchy

Average Actions/hour

Aggressive

		Received			
		Rank 1	2	3	4
Initiated	1	----	1.3	1.3	5.5
	2	0.3	----	3.7	5.3
	3	0.2	0.3	----	13.0
	4	0.2	0.2	0.3	----
	⋮	⋮	⋮	⋮	⋮
	⋮	⋮	⋮	⋮	⋮

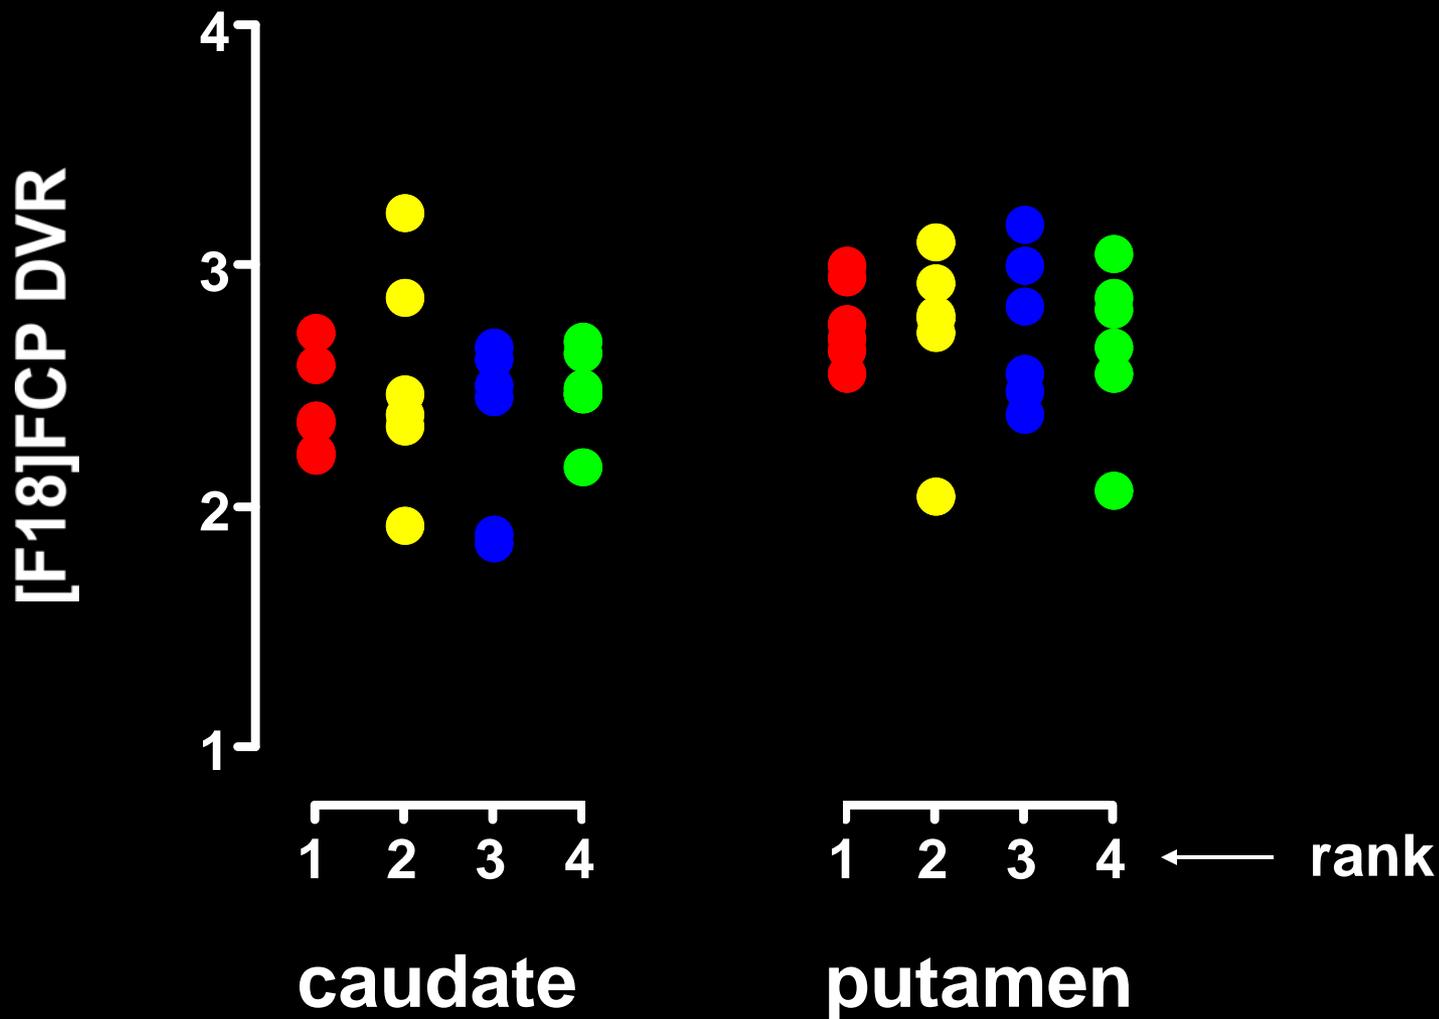

Submissive

		Received			
		Rank 1	2	3	4
Initiated	1	----	0.1	0.0	0.0
	2	4.9	----	0.1	0.0
	3	10.6	3.9	----	0.2
	4	14.7	9.2	19.8	----
	⋮	⋮	⋮	⋮	⋮
	⋮	⋮	⋮	⋮	⋮

n = 6 @ each rank

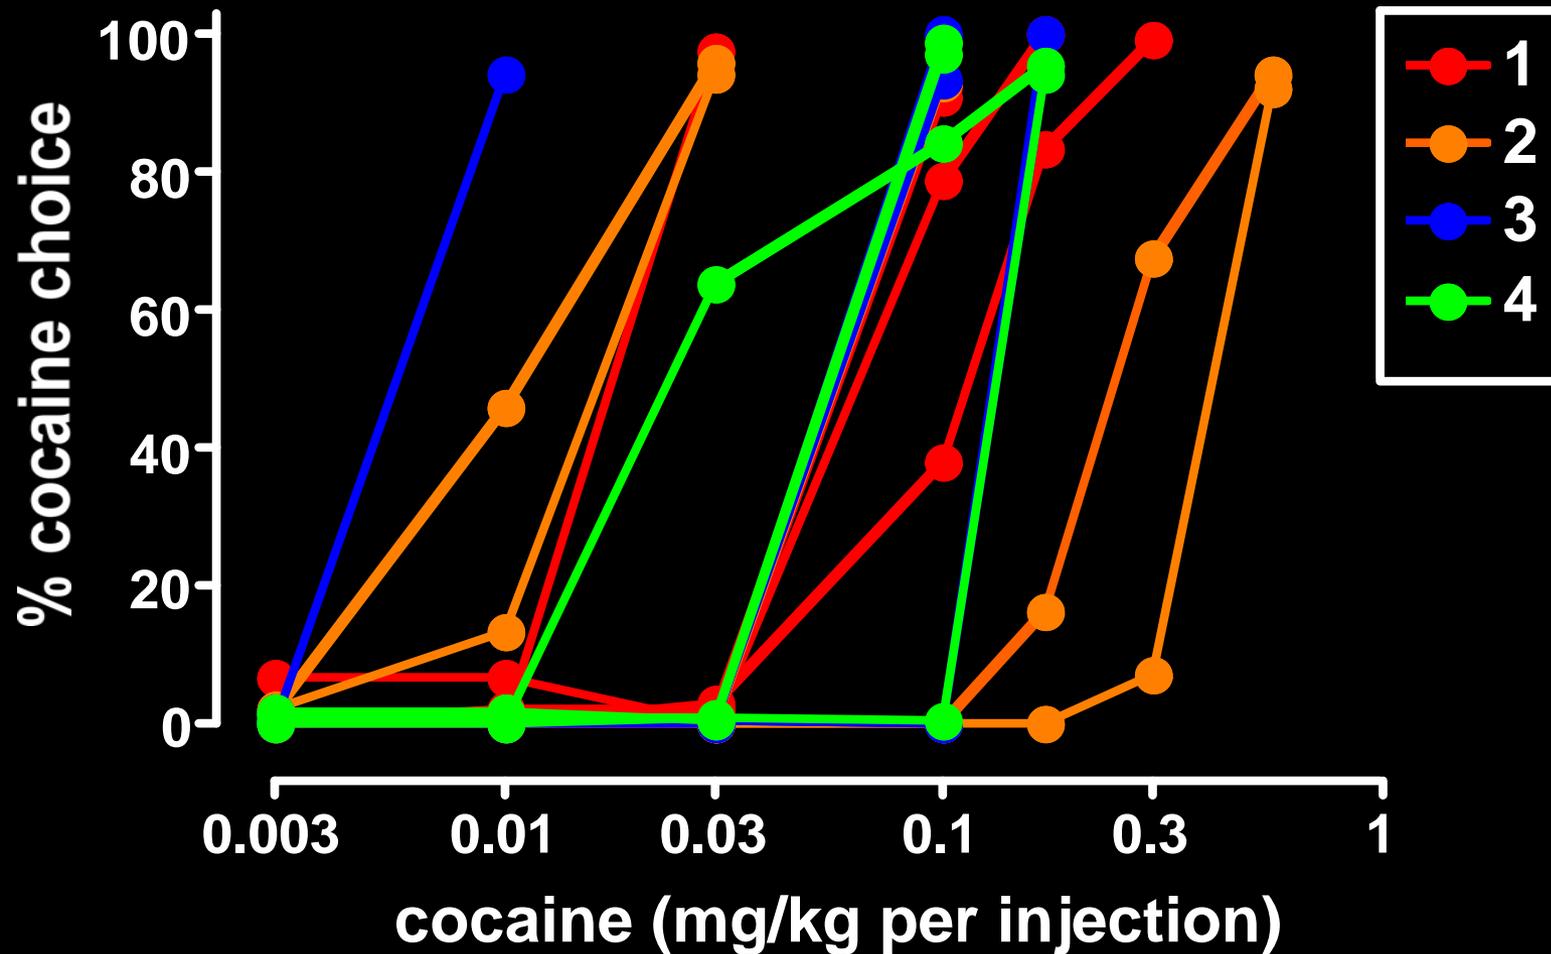

D2 receptor availability in “reorganized” monkeys

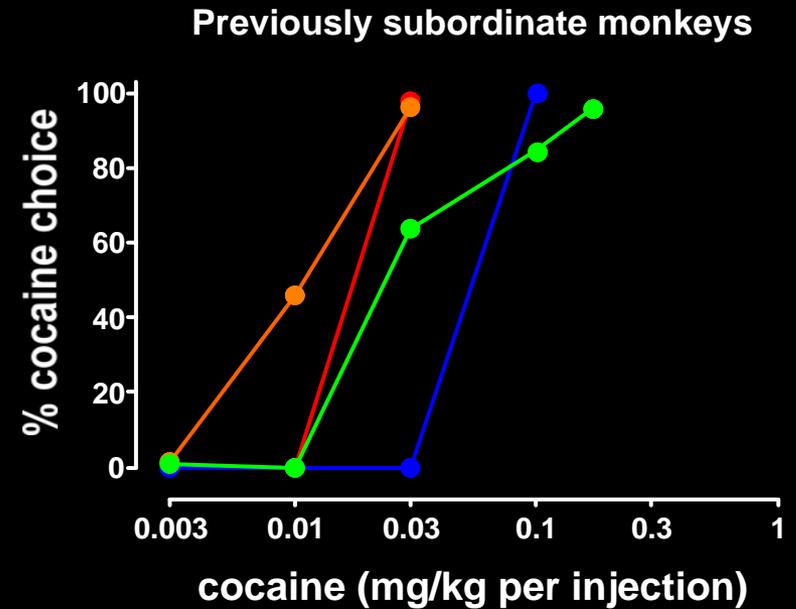

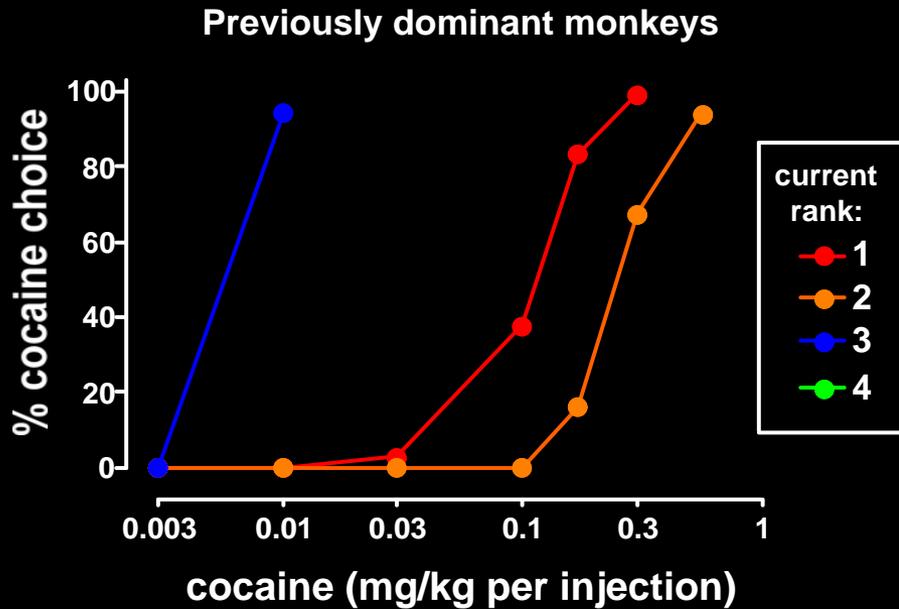

individual subject data

Cocaine choice in “reorganized” monkeys

individual subject data

Influence of environmental variables on the brain and behavior persists, but may be influenced by social housing and/or drug history.

SUMMARY

The combination of nonhuman primate social behavior, models of drug abuse, behavioral pharmacology and noninvasive brain imaging techniques has provided important evidence regarding:

- the neurobiological basis of vulnerability to addictive effects of drugs. D2 receptors and social rank; CSF and impulsivity.
- the influence of environmental variables on brain function and behavior. Social rank and drug choice.
- neurobiological changes produced by long-term drug use, abstinence and reorganization. An interaction between previous social rank and current conditions on D2 receptors and cocaine reinforcement .

SUMMARY

The environment exerts profound effects on brain function that can impact clinical outcomes.

O'Brien and Anthony (2005): education has an inverse relationship with risk of becoming cocaine dependent.

Butzin et al. (2005): work release programs for inmates resulted in greater abstinence rates and higher rates of employment after leaving the program.

Daniel et al. (2006): exercise reduces desire to smoke cigarettes and reduces withdrawal symptoms.

Winkelman (2003): percussion instruments (drums) during treatment. Music reduces stress, is reinforcing, enhances awareness and alleviates isolation.
