Delaware Opioid Summary

Drug Overdose Deaths

In 2017, there were more than 70,200 drug overdose deaths in the U.S.—an age-adjusted rate of 21.7 per 100,000 persons. Among these, 47,600 involved opioids. The sharpest increase occurred among deaths involving fentanyl and fentanyl analogs (other synthetic narcotics) with more than 28,400 overdose deaths in 2017.

The age-adjusted rate of drug overdose deaths increased significantly in Delaware by 20.2 percent from 2016 (30.8 per 100,000) to 2017 (37.0 per 100,000). While the majority of drug overdose deaths in 2017 involved an opioid, overdose deaths involving opioids are not included for the state because the data reported did not meet inclusion criteria (see Scholl L, et al. MMWR Morbidity and Mortality Weekly Report 2019;67:1419–1427).

Opioid Pain Reliever Prescriptions

The opioid prescribing rate in Delaware has decreased by more than 30 percent from 101.1 opioid prescriptions per 100 persons in 2010 to 68.3 opioid prescriptions for every 100 persons in 2017 (Figure 2). The average U.S. rate in 2017 was 58.7 prescriptions per 100 persons (CDC).

Neonatal Abstinence Syndrome (NAS)

NAS or neonatal opioid withdrawal syndrome (NOWS) may occur when a pregnant woman uses drugs such as opioids during pregnancy. A recent national study revealed a fivefold increase in the incidence of NAS/NOWS between 2004 and 2014, from 1.5 cases per 1,000 hospital births to 8.0 cases per 1,000 hospital births. This is the equivalent of one baby born with symptoms of NAS/NOWS every 15 minutes in the United States. During the same period, hospital costs for NAS/NOWS births increased from $91 million to $563 million, after adjusting for inflation (Figure 3).
To date, there is no standard in NAS/NOWS provider and hospital coding practices (CDC). As a result, there is variability in trends and in the rate reported by states. There is no recent available data on the rate or number of babies born with NAS/NOWS in the state of Delaware.

**HIV Prevalence and HIV Diagnoses Attributed to Injection Drug Use (IDU)**
U.S. Incidence: In 2016, 9 percent (3,480) of the 39,589 new diagnoses of HIV in the United States were attributed to IDU. Among males, 6.3 percent (2,530) of new cases were transmitted via IDU or male-to-male contact and IDU. Among females, 2.3 percent (950) were transmitted via IDU (CDC).

U.S. Prevalence: In 2016, 991,447 Americans were living with a diagnosed HIV infection—a rate of 306.6 cases per 100,000 persons. Among males, 19.9 percent (150,4661) contracted HIV from IDU or male-to-male contact and IDU while 21 percent (50,154) of females were living with HIV attributed to IDU (CDC).

State Incidence: Of the new HIV cases in 2016, 117 occurred in Delaware. Among males, 6.6 percent of new HIV cases were attributed to IDU or male-to-male contact and IDU. There were no reports of new HIV cases transmitted via IDU among women (Figure 4) (AIDSVu).

State Prevalence: In 2015, an estimated 3,230 persons were living with a diagnosed HIV infection in Delaware—a rate of 404 cases per 100,000 persons. Of those, 25.0 percent of cases among
males were attributed to IDU or male-to-male contact and IDU. Among females, 25.4 percent were living with HIV attributed to IDU (AIDSVu).

**Hepatitis C (HCV) Prevalence and HCV Diagnoses Attributed to Injection Drug Use**¹

- **U.S. Incidence:** In 2016, there were an estimated 41,200 new cases of acute HCV² (CDC). Among case reports that contain information about IDU, 68.6 percent indicated use of injection drugs (CDC).

- **U.S. Prevalence:** An estimated 2.4 million Americans are living with HCV based on 2013-2016 annual averages (CDC).

- **State Incidence:** There were approximately 25 new cases of acute HCV (2.6 per 100,000 persons) reported in Delaware in 2016 (CDC).

- **State Prevalence:** In Delaware, there are an estimated 6,400 persons living with Hepatitis C (2013-2016 annual average), a rate of 880 cases per 100,000 persons (HepVu).

Notes

1. Not all states collect or report data on the incidence or prevalence of Hepatitis C or on how Hepatitis C is transmitted. When available, the data will be included.

2. Actual acute cases are estimated to be 13.9 times the number of reported cases in any year.
